Energy transferred per unit time = $P = T \times v = Mgv \sin\theta = mgv$

9 D

Horizontal component of velocity = $u_x = \dfrac{18}{1.5} = 12\ \text{m s}^{-1}$

At the highest point , kinetic energy = $\frac{1}{2} \times m \times u_x^2 = \frac{1}{2} \times 0.40 \times 12^2 = 28.8$ J

10 B
