26	**Ans: A** e.m.f between axle and the rim of the Faraday's disc generator $E = BAf = B\pi r^2 f$ Since Q and S are the mid points between the axle and the rim, the radius is ½ R and area of the enclosed circle is ¼ of the entire disc area. Therefore the e.m.f between point O and point Q or S is ¼ $B\pi r^2 f$ hence e.m.f between O and Q and between O and S are E/4. However since the electrons at point Q and S are travelling in opposite directions, their polarities of the e.m.f are opposite and hence they cancel out so net emf is zero.
