28	**Ans: D** The KE of the particles is given by $KE = q\Delta V$ Since the electron and the proton have the same charge, and are accelerated over the same p.d., they have the same energy. The de Broglie wavelength is found using the formula $\lambda = \frac{h}{p}$ where $\frac{p^2}{2m} = KE$ so $\lambda = \frac{h}{\sqrt{2mq\Delta V}}$ Since the proton has greater mass than the electron, it has a smaller de Broglie wavelength. All other variables in the equation are identical between the proton and the electron.
29	**Ans: B**
