3	(a)	Vertical component of the initial velocity, $u_y = 0$	[M1]
		$s_y = \frac{1}{2}a_y t^2$	
		$= \frac{1}{2}(9.81)(2.5)^2$	[M1]
		$= 31$ m	[A0]
	(b)	$u_x = v_x = \frac{240}{2.5} = 96.0$ m s^{-1}	[C1]
		$v_y = a_y t = (9.81)(2.5) = 24.5$ m s^{-1}	[C1]
		Resultant velocity, $v = \sqrt{(96.0)^2 + (24.5)^2} = 99.1$ m s^{-1}	[A1]
		Direction, $\theta = \tan^{-1}\frac{24.5}{96.0} = 14.3°$ clockwise below horizontal	[A1]
	(c)	Even though the initial speed had increased, the initial vertical component of the speed remains the same.	[M1]
		Hence there is no change to the time of flight.	[A1]
