		$a = r\omega^2 \Rightarrow$ as r increases, a increases
10	**B**	At the top of circle, tension and weight provide the centripetal force so, $T + mg = mr\omega^2 \Rightarrow T = -mg + mr\omega^2$ At the bottom of circle, tension minus weight provide the centripetal force so, $T - mg = mr\omega^2 \Rightarrow T = mg + mr\omega^2$ the variation of the tension = difference in the values of $T = 2mg$
11	**B**	Option A : All geostationary satellites are of same distance of the Earth, hence, they
