		$\frac{I_Q}{A_Q} \quad (A)$
15	**C**	$a\sin\theta = n\lambda$ $\frac{1}{300\times1000}\sin 90° = n\times 690\times10^{-9}$ $n_{max} \approx 4.83$ Since the order number n must be an integer, the highest observable order of bright spots is $n = 4$. Total number of bright spots = 4 + 1 + 4 = 9
16	**D**	Since temperature is the same, the mean kinetic energy of the particles is the same.
