		$I_{rms} = \sqrt{2}I$
22	**A**	According to $R = \frac{\rho L}{A}$, if, as L increases, A also increases, then the increase in R will not be as great. So, the gradient of the graph will become gentler. Similarly, if, as L increases, A decreases, then the increase in R will be greater. So, the gradient of the graph will become steeper.
