		Since direction of Δx is vertical, the direction of Δp must also be vertical.
29	**C**	When $\frac{\text{number of tin-124 nuclei}}{\text{number of antimony-124 nuclei}} = \frac{10}{1}$, this means the ratio $\frac{\text{number of antimony-124 nuclei, } N}{\text{initial number of antimony-124 nuclei, } N_0} = \frac{1}{11}$ Using, $N = N_0 e^{-\lambda t} \quad \Rightarrow \quad \ln\left(\frac{1}{11}\right) = -\frac{\ln 2}{60} \times t$ So, t = 208 days
30	**D**	Energy released = BE of product particles – BE of reactant particle
