		resultant force A, B and C are non-zero.
3	A	As the person walks closer to Q, the distance to the pivot Q decreases which reduces the clockwise moments. Thus the anticlockwise moment and hence downward force at P needed decreases. For the board to stay in vertical equilibrium, the upward force at Q also decreases since the weights remain the same.
4	C	Weight of the person is the gravitational force on the person by the Earth, thus reaction
