7	A	By conservation of energy, both coins begin with the same gravitational potential energy, so they will hit the ground with the same kinetic energy, hence both coins hit the ground with the same speed. Option B is wrong. Coin Y moves up before falling down. Thus distance travel by coin Y is larger than that of X. Option C is wrong. Coin Y takes a longer time to reach the ground than X. Option D is wrong. Since air resistance is negligible, both coins has the same acceleration.
