

26 L3	Solution: D As the current in the solenoid is alternating, the amplitude of the e.m.f. induced in the search coil is proportional to the max magnetic flux density which varies sinusoidally The maximum magnetic flux density along the length of the solenoid is uniform since it is long. The maximum magnetic flux density near the ends decreases. Hence maximum e.m.f. induced in the search coil is almost constant along the length of the solenoid and decreases at the ends.	
27	Answer: A
