

	motion. Hence the time taken to rise is shorter than the time taken to fall.	
5 L3	Solution: C The initial momentum of the body = $(2.0)(18) = 36 \text{ N s}$ to the right The change in momentum = area under the graph = $(10)(5) + (0.5)(2)(10)$ = 60 N s The applied force is to the left hence the change in the momentum is to the left. final momentum of the body = initial momentum + change in momentum = $36 + (-60) = -24 \text{ N s}$ to the right final velocity = $-24 / 2.0 = -12 \text{ m s}^{-1}$ to the right i.e. 12 m s^{-1} to the left	

6	Solution: B
