

6	(a)	(i)	$^{14}_7\text{N} + ^4_2\text{He} \rightarrow ^{17}_8\text{O} + ^1_1\text{H}$. Symbol, mass number and atomic number of alpha particle Symbol, mass number and atomic number of proton Correct representation of nuclear equation	
		(ii)	Sum of the masses of $^{14}_7\text{N}$ and an α -particle $= 13.9993 \text{ u} + 4.0015 \text{ u}$ $= 18.0008 \text{ u}$ Sum of the masses of $^{17}_8\text{O}$ and proton $= 16.9947 \text{ u} + 1.0073 \text{ u}$ $= 18.0020 \text{ u}$ increase in mass during reaction $= 18.0020 \text{ u} - 18.0008 \text{ u}$ $= 0.0012 \text{ u}$ The minimum energy is to be supplied to the reactants in the form of kinetic energy of the α -particle The kinetic energy of the alpha particle $= \text{mass increase} \times c^2$ $= 0.0012 \text{ u} \times c^2$ $= 0.0012 \times 1.66 \times 10^{-27} \times (3 \times 10^8)^2$ $= 1.79 \times 10^{-13} \text{ J}$	
	(b)		A radioactive isotope of thallium $^{207}_{81}\text{Tl}$ emits a β -particle and is thought to emit a gamma photon. The half-life of $^{207}_{81}\text{Tl}$ is 135 days.	
	(b)	(i)	<u>Circular paths</u> of small radii show that beta particles are present and that beta particles are <u>charged</u> . Circular paths of <u>different radii</u> show that the beta particles have <u>different speed</u> and hence different kinetic energy. The faint <u>straight line</u> path shows the presence of gamma ray photons which have <u>no charge</u> and not deflected by the magnetic field. The <u>faint</u> path shows that the gamma ray photon has much <u>less ionization ability</u> as compared to the beta particles. Max 3 marks	
		(ii)	Energy available from 1 g of thallium-207 $= \text{number of thallium-207 atoms} \times 2.4 \times 10^{-13}$ $= (1/207) \times 6.02 \times 10^{23} \times 2.4 \times 10^{-13}$ $= 6.98 \times 10^8 \text{ J}$	
		1.	Initial rate of β -particle emission, A_0 $= \text{(initial) activity of thallium}$ $= \text{decay constant} \times \text{number of thallium nuclei}$ $= (\ln 2 / \text{half-life}) \times \text{number of thallium nuclei}$ $= (\ln 2 / 135) \times (1/207) \times 6.02 \times 10^{23}$ $= 1.493 \times 10^{19}$ $= 1.5 \times 10^{19} \text{ day}^{-1}$	
		2.	Initial power = initial rate x energy of a β -particle $= [1.493 \times 10^{19} / (24 \times 60 \times 60)] \times 2.4 \times 10^{-13}$ $= 41.5 \text{ W}$
