

		$\frac{P}{4} \times V = n_2 RT \text{ ----- (2)}$
16	B	Initial state, X: $P \times 1.5 V = n_1 RT \text{ ----- (1)}$ Y: $\frac{P}{4} \times V = n_2 RT \text{ ----- (2)}$ Final state, conserving the mass (number of moles): $P' (2.5V) = 1.5PV + \frac{PV}{4}$ $P' = 0.7 P$
17	B	Heat was removed from it at a constant rate
