

		$\rho = 0.7 \text{ g cm}^{-3}$
17	B	Heat was removed from it at a constant rate. $m(\text{specific heat capacity of liquid})(400 - 300)/(100)$ $= m(\text{specific heat capacity of solid})(300 - 200)/(50)$ $(\text{specific heat capacity of liquid}) = 2 \times (\text{specific heat capacity of solid})$
18	B	Since both X and Y are stationary and the mass of X is twice of Y, we can conclude that
