

		(specific heat capacity of liquid) = 2 $\times$ (specific heat capacity of solid)
18	B	Since both X and Y are stationary and the mass of X is twice of Y, we can conclude that the charge on X is twice of Y. When the plates are moved further apart, the electric field strength decreases, hence there is a net force acting downwards on both X and Y. Applying Newton's second law: X: $2mg - 2qE = 2ma$

		Y: $mg - qE = ma$
