

		When a kettle is plugged into a primary centre grounded system with a recommended voltage of $V = 120$ V, it consumes 1.5 kWh of energy in 1.5 h.
26	B	Since $P \sim V^2$, if kettle is connected to mains voltage that is half the recommended value, its power consumption will be only a quarter, ie 0.5kW. Hence energy consumed in 1.5h is 0.75 kWh.
27	D	When ϕ_A across Γ and Γ are zero, the electrode with a lower work function will emit more electrons than the other.
