

		r T Bq
24	C	The magnetic force acting on the proton is upwards. To balance this force, so that the proton would pass undeflected, the electric force on the proton acts downwards, so the electric field is directed downwards. $v = \frac{E}{B} \rightarrow E = Bv = (1.5)(2.00 \times 10^7) = \mathbf{3.00 \times 10^7 \text{ N C}^{-1}}$
25	D	When the bar magnet begin to fall through the solenoid the flux linkage through the
