14 Two coherent wave sources, S_1 and S_2, emit light waves of the same frequency but different intensity. The intensity of the wave from S_1 is $4I$ while the intensity of the wave from S_2 is I.

The waves meet at point P to form a bright fringe due to constructive interference and meet at point Q to form a dark fringe due to destructive interference.

What is the ratio of the intensity of light at point P to the intensity of light at point Q?

A 0.11 **B** 1.7 **C** 4.0 **D** 9.0
