

- 25 A piece of wire WXYZ is pivoted freely about a horizontal axis at points W and Z. Section XY of the wire is situated between the North (N) and South (S) poles of a horse-shoe magnet. WXYZ is connected to an electrical circuit.

What will happen to the wire, if any, when the circuit is just turned on and there is a constant current I in the wire as shown?

- A swings to the left
- B swings to the right
- C swings from X to Y
- D remains at rest at its original position
