

		L is the length of the rod in contact with the rail.
25	B	Centripetal force when entering is upwards hence magnetic force is upwards. Using Fleming's right hand rule, current is in the same direction as the path so it must be positively charged. If direction of magnetic force is upwards, electric force must be downwards so electric field must also be downwards.
26	C	Laminating the iron core in a transformer narrows the eddy current paths which reduces the
