

|  |      |                                                                                                                                        |
|--|------|----------------------------------------------------------------------------------------------------------------------------------------|
|  |      | electric field must also be downwards.                                                                                                 |
|  | 26 C | Laminating the iron core in a transformer narrows the eddy current paths which reduces the induced e.m.f. and hence the eddy currents. |
|  | 27 D | For a transformer with a primary current of 40 A and a                                                                                 |
