Compare mechanical energy at hilltop to that at top of loop.
By Conservation of Energy,

gain in KE = loss in GPE

$$\frac{1}{2}mv^2 - 0 = mg(h_{\text{hilltop}} - h_{\text{top of loop}})$$

$$F_{\text{net}} = \frac{mv^2}{r} = \frac{2mg(85 - 40)}{20}$$

$$N + mg = \frac{9}{2}mg \text{ (at top of loop)}$$

$$N = 3.5mg = 3.5W$$
