

on release.

4

D

Since bathroom scales reading (which is equal to contact force from scale on person) is less than weight, the net force on person is downwards. The acceleration of the person is directed downwards. This applies either when the person is moving downwards is speeding up, or when the person is moving upwards and slowing down.

A and C are wrong as the person has acceleration, so cannot be moving at constant speed.

B is wrong. When movement is downwards and slowing down, acceleration is upwards.
