

- 7 C Max pressure the probe can take = atmospheric pressure + pressure due to the liquid

On Earth:

$$\text{Max pressure} = 100 \times 10^3 + (64)(1000)(9.81) = 727840 \text{ Pa}$$

On Moon of Saturn:

$$727840 = 35 \times 10^3 + h (740) (3.6)$$

$$h = \mathbf{260 \text{ m}}$$

- 8 D When $T = (D + W/2)$, the net force on the lift is 0
