

- 10 B For a satellite of mass m in orbit at distance r from Earth of mass M
its KE can expressed as $K = GMm / 2r$, i.e. K is proportional to $1/r$.
its GPE $U = - GMm / r = - 2K$
its total energy $T = - GMm / 2r = - K$

11 R Internal energy is the sum of a random distribution of kinetic and potential energies associated
