

electric potential = 5V (electric potential adds up and all charges at same distance from X)

- 22** A graph of current against potential difference for a component is given below.

[Turn over]

		What is the potential difference across the component when its resistance is at its lowest?																							
A	1.5 V	B	4.0 V	C	5.0 V	D	7.0 V																		

Ans: C

Lowest resistance occurs at the point where the ratio V/I is the lowest.

This is when the gradient of the line joining the point and the origin is the highest. (gradient is given by $\frac{I}{V}$ so a high value gives lowest $\frac{V}{I}$)

This occurs at 5.0 V
