

30.

Ans: A

Option A: True. They both have ionising power, just that α -particles have stronger ionising power, γ -rays have weaker ionisation power.

Option B: False. α -particles are stopped by a few millimetres of aluminium.

Option C: False. γ -rays have no charge so do not experience any magnetic force when in a magnetic field. Hence no deflection.

Option D: False. Emission of γ -rays does not change the nuclear structure of the radioactive nucleus.
