

6.	Ans: A B incorrect: The man is also accelerating downwards. Net force acting on him is downwards. Hence, the weight of man must be greater than the force exerted by the elevator on man (normal contact force). C incorrect: In order for the elevator to accelerate downwards, there must be a net force acting downwards. Hence, the weight of man and elevator must be greater than the tension. D incorrect: The two forces are not action-reaction forces because both forces acting on the same body (man).
7.	Ans: B
