

		The field is in the opposite direction to the initial.
28	C	A: True. As $\omega = \frac{\theta}{t}$, from graph it is clear that angular velocity is a constant. B: True. At 0.4 s, the angle rotated is 360°, the rate of cutting of magnetic flux linkage is the largest possible. C: False. At 0.4 s, the angle rotated is 360°, the flux linkage is zero at that instant. D: True. The flux linkage follows the equation $NBA\sin(\omega t)$. So, induced e.m.f. will follow the equation of $-NBA\omega\cos(\omega t)$
29	B	When the potential at X is higher than the potential at Y, the total resistance
