**15** A telescope with an aperture of 20 cm receives light of wavelength 580 nm from a binary star system which can just be resolved by the telescope.

The two stars are $7.3 \times 10^{17}$ m from the telescope.

How far apart are the two stars?

**A** $2.1 \times 10^{12}$ m **B** $2.5 \times 10^{16}$ m **C** $2.1 \times 10^{19}$ m **D** $2.5 \times 10^{23}$ m
