14 A mass of 0.140 kg extends a spring by 0.055 m at equilibrium. The spring has a force constant of 25.0 N m^{-1}.

The mass is pulled down a further 0.015 m from its equilibrium position and set into simple harmonic motion.

Determine the gain in elastic potential energy (EPE) of the mass when it is pulled down 0.015 m, and its energy of oscillation.

	gain in EPE / J	energy of oscillation / J
A	0.023	0.023
B	0.023	0.0028
C	0.0028	0.023
D	0.0028	0.0028
