18 In a heating experiment, energy is supplied at a constant rate to a liquid in a beaker of negligible heat capacity. The temperature of the liquid rises by 4.0 K per minute just before it begins to boil. After 40 minutes, all the liquid has boiled away.

For this liquid, what is the ratio of its specific heat capacity to specific latent heat of vaporisation?

A $0.10\ K^{-1}$ **B** $0.025\ K^{-1}$ **C** $0.0063\ K^{-1}$ **D** $0.0016\ K^{-1}$
