

		$= +4.5 \text{ MV}$
21	B	Direction of electric field line is directed away from a positive charge that sets it up in the first place. Whether the field strength increases or not depends on how closely together the electric field lines are to one another. However, the further the distance from the electric field line, the lesser is the electric potential due to the positive charge.
22	B	The circuit is equivalent to 2 sets of parallel resistors in series with each other
