

		Potential drop across JM = IR and potential drop across ML = $2IR$
24	C	The path cannot be due to a magnetic field because the magnetic force acting on the charged particle will be into the page (positive charge) or out of the page (negative charge). Hence, the field must be an electric field and since the charged particle is deflected downwards, the charge is positive.
25	D	Let the velocity of the rod down the slope be v
