

|           |                                                                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | current increases.                                                                                                                                                                                                                                                    |
| <b>25</b> | <p><b>C</b></p> <p>For a straight conductor moving perpendicularly in a uniform magnetic field, <math>E = B/v</math>.<br/>         Since, <math>B</math> (magnetic flux density) and <math>l</math> (length of conductor) are constant, <math>E \propto v</math>.</p> |

|    |                                                                                             |
|----|---------------------------------------------------------------------------------------------|
|    | From $s$ - $t$ graph, the $v$ - $t$ graph is similar to the graph in C. Hence, answer is C. |
