

14	Answer: D
	Note that θ is measured with respect from the polarising axis of P_1. Let the light emerging from P_1, P_2 and P_3 have intensity I_1, I_2, I_3 respectively. $I_3 = I_2 \cos^2 (\theta - 30)^\circ = I_1 \cos^2 30^\circ \cos^2 (\theta - 30)^\circ$ $14 = 30 \cos^2 30^\circ \cos^2 (\theta - 30)^\circ$ $\theta = 68^\circ$
