

1	Answer: A
	Notice that the options are all given in electrical units, hence we express <i>power</i> in terms of <i>potential difference</i> and <i>current</i>. $\text{unit for } k = \frac{\text{unit for } (IV)}{\text{unit for } (I)^2} \left(\frac{\cancel{\text{unit for } \lambda}}{\cancel{\text{unit for } L}} \right)^2$ $= \frac{\text{unit for } (V)}{\text{unit for } (I)} = \text{unit for } (R) = \Omega$

2	Answer: D
