

25	Answer: B $\text{Intensity} = \frac{\text{Power}}{\text{Area}} = \left(\frac{n_{\text{photon}}}{t} \right) \frac{hf}{A}$ $E_{\text{photon}} = hf = \phi + eV_s$ • From graph, saturated current constant $\Rightarrow$ number of electrons constant $\Rightarrow$ no. of photons per unit time constant • stopping potential is smaller $\Rightarrow$ KE_{max} smaller $\Rightarrow$ f smaller Hence, intensity must be lower.
----	---

26	Answer: B
