

		Hence, the net force on S towards N .
25	C	The copper disc “sees” the magnet rotating. The portion of the disc either “sees” an approaching pole or a pole moving away. By Lenz’s law, in order to “oppose” the change (which again, is the rotation of the magnet), the disc will tend to rotate in the same direction as the magnet so that the magnet will appear “stationary” from the disc’s perspective.
26	B	Using the rotational kinematics equation, $\omega = \omega_0 + \alpha t$, where $\omega_0 = 0$, $\alpha = (1500) = 100\pi$
