

25	C	Emf of a rotating disc of radius L $= \frac{\text{Change in flux}}{\text{Time}}$ $= \frac{B \cdot \pi L^2}{T}$ $= \frac{B \cdot \pi L^2}{\frac{2\pi}{\omega}}$ $= \frac{1}{2} BL^2 \omega$ $ e = \frac{1}{2} BL^2 \omega.$ Emf between R and S = $\frac{1}{2} BL^2 \omega - \frac{1}{2} B(L/2)^2 \omega = \frac{3}{4} (\frac{1}{2} BL^2 \omega)$ According to the question $E = \frac{1}{2} BL^2 \omega$, therefore, emf between R and S is $\frac{3}{4} E$
26	A	Since inner loop experiences decreasing flux linkage, current in the inner
