

26.

Ans: D

Option A is incorrect:

Low intensity high frequency can result in photoelectric effect.

Option B is incorrect:

$$hf - \Phi = eV_s$$

$$h(2f) - \Phi \neq e(2V_s)$$

Option C is incorrect:

This option is correct for **min frequency** so should have been *max* wavelength.

Option D is **CORRECT**:

Increasing intensity for a monochromatic light will increase the number of photons incident.

27.

Ans: C
