

Q24 Ans: D

Electrons either accumulate in the centre or at the rim. In either case, 2 points equidistant from O will have the same potential, and the difference in potential between O and a point gets larger with distance. Therefore, $E_{XY} = E_{YZ}$.

Since points further from O travel faster, the length XY cuts flux faster than YO. Therefore, $E_{XY} > E_{YO}$.

Q25 Ans: D
