

23. Four identical wires A, B, C and D carry currents, of equal magnitude, in the directions as shown in the figure below. What is the direction of the resultant magnetic force experienced by wire A?

Ans: A

Parallel conductors carrying currents in the *opposite* direction will *repel* each other. So wire A is repelled by the other 3 wires.

Therefore, the resultant, R of the three forces acting on wire A is as shown below:

24 A closed circular loop of wire has a radius of 3.7 cm. It is bent along a diameter such
