

	$77 - 125 \text{ m} = 150 \text{ m}$	
5(a)	E.m.f. is the work done/energy required to move a unit charge around a complete circuit and in the process, non-electrical energy is converted to electrical energy. Potential difference is the work done/energy required to move a unit charge across a component and in the process, electrical energy is converted to non-electrical forms.	[1] correct definition [1] correct definition
5(b)(i)		[1] correct symbol

5(b)(ii)	At, temperature of 5 ° C, resistance of thermistor is 2.85 kΩ By potential divider principle, $V = \frac{5}{5 + 2.85} \times 9$ $= 5.7 \text{ V}$	[1] correct resistance reading from graph [1] answer
5(b)(iii)	The temperature probe is not sensitive to changes in temperatures between 5 °C to 35 °C, especially in the range of 30 °C to 35 °C As the voltmeter has a precision of 0.1 V, the change in potential difference due to changes in resistance from 30 °C to 35 °C will not be able to be measured by the voltmeter.	[1] correct range mentioned [1] voltmeter precision
6(a)	Magnetic flux density is defined as the magnetic force per unit	[1] or zero
