1 A ball bearing is drop from rest and it took time t to fall for a distance h where

$$h = \frac{1}{2} g t^2$$

The reading for t is

$$t = (0.4000 \pm 0.0008)\ \text{s}$$

What is the maximum percentage uncertainty in h such that the gravitational acceleration g can be determined with a maximum uncertainty of $\pm$ 2 %?

A 1.6 % **B** 1.8 % **C** 2.2 % **D** 2.4 %
