27 When light of a certain frequency and intensity is incident on europium metal, electrons are observed to be emitted from the metal. This is known as the photoelectric effect.

If the intensity of the light is increased and the frequency of the light remains unchanged, which of the following describe the changes observed?

	threshold frequency of europium	number of electrons emitted
A	decreases	remains the same
B	decreases	increases
C	remains the same	remains the same
D	remains the same	increases
