30 For many unstable parent nuclei, the daughter product is itself radioactive.

Initially, only the parent isotope P is present in the sample.

The parent isotope P decays into the daughter product D_1 which decays to form the further daughter D_2.

The variation with time of the number of nuclei of P, D_1 and D_2 are shown below.

Which of the following correctly describe the half-lives of P and D_1?

	P	D_1
A	3 years	20 years
B	3 years	15 years
C	6 years	20 years
D	6 years	15 years
