

Ans: D

- 15** A beam of light goes through a polarizing filter, then through a sugar solution, then through a second polarizing filter. The polarizing axes of the two filters are initially aligned.

The sugar solution has the effect of rotating the light's plane of polarization clockwise by 45° .

- A** 45° clockwise
- B** 45° anti-clockwise
- C** 90° clockwise
- D** 90° anti-clockwise

Answer: B

- 16** An interference pattern is formed on a screen by the superposition of two coherent light beams,
