

		$(2) - (1)$ $V_2 - V_1 = 0.35 \text{ V}$
28	C	$E = \frac{1}{2} m v^2$; $p = mv$ $\therefore E = \frac{p^2}{2m}$ $p = \sqrt{2mE}$ $\lambda = h/p = h / \sqrt{2mE}$ $\lambda \propto 1/\sqrt{E}$ The graph of λ vs $1/\sqrt{E}$ is a positive gradient straight line through the origin
29	D	Statement 1: False. The greater the binding energy <u>per nucleon</u> of a nucleus, the more stable it is.
